

Solace AI Hackathon Task

Solace AI – An AI-Powered Wellness Companion

> **Objective**
>
> Create a beautiful, calming and intelligent mobile wellness companion that helps users understand their emotions, take care of themselves and build healthier daily habits.
>
> The objective is to build a functional **mobile application prototype** that demonstrates the core experience, features and capabilities of Solace.

Task Overview

Solace AI is an AI-powered wellness companion designed to make everyday mental wellness more personal, simple and engaging.

The goal is to create a prototype mobile experience that feels relaxing, welcoming and genuinely useful.

We will provide a reference video showing the experience and features we want to build. Your task is to use that video as a starting point and create your own improved mobile prototype.

You are not expected to replicate the reference video screen by screen. We want you to rethink the experience, improve the overall design and introduce your own ideas.

Think about the complete user journey, from opening the application for the first time to using it as part of a daily routine.

You have creative freedom over the interface, interactions, animations, features and overall experience.

Reference Video

Reference Video:

https://drive.google.com/file/d/1t427-C13s0plxl4m-a207v2Dy8d2KcpC/view?usp=sharing

The attached video demonstrates the reference experience that you should use to understand the product's direction and core functionality.

Use it as a starting point, not as a fixed design or implementation guide.

User Journey

1. Splash Screen

Create a beautiful opening experience that introduces the product and its purpose.

The screen should communicate the feeling and mission of the application.

You have complete freedom over the visual treatment, animations and presentation.

2. Onboarding

Create a simple and engaging onboarding experience that helps users understand what the application does and how it can help them.

Communicate the purpose of the product, its key benefits and the role of its AI companion.

Keep the experience short, welcoming and easy to follow.

3. Sign Up and Login

Create a smooth authentication experience.

Users should be able to create an account, log in and access their personal experience.

You can decide how to approach the authentication flow and profile setup.

4. Home Experience

The home screen should be the central place where users interact with the application.

Think about how to make it feel personal, calming and engaging.

Some possible elements include:

- Personalized welcome message.
- Daily mood check-in.
- Daily affirmations.
- AI-powered suggestions.
- Quick access to wellness activities.
- Breathing exercises.
- Personal progress and streaks.
- Daily wellness recommendations.

You do not need to follow the layout shown in the reference video.

Think about what would make someone genuinely enjoy opening the application every day.

5. Main Navigation

Create a simple and intuitive navigation experience.

Users should be able to move between the main sections of the application without confusion.

You can rethink the navigation structure and screen organization if you feel a different approach would create a better experience.

AI Experience

AI is one of the most important parts of this assignment.

We want to create an AI companion that feels personal, intelligent and genuinely helpful.

It should be more than a regular chatbot.

Think about how AI can become an important part of the user's daily wellness journey.

Some directions you can explore:

1. AI Companion

Create an AI companion with its own personality and conversational experience.

You can introduce a mascot, character or animated avatar that represents the AI.

The companion should feel friendly and approachable. It could welcome users, respond to their moods and become a familiar part of the application.

2. Natural Conversations

Users should be able to talk to the AI naturally about their feelings, thoughts and everyday experiences.

The AI should:

- Understand the user's current mood.

- Respond with empathy and relevant suggestions.
- Maintain context during conversations.
- Provide thoughtful and personalized responses.
- Suggest useful activities when appropriate.

Avoid generic motivational responses. The conversations should feel meaningful.

3. Personalized AI Experience

Explore how the AI can understand users better over time.

It could use relevant information such as previous conversations, mood check-ins, wellness assessments and user preferences.

Use this context to provide more personalized suggestions and recommendations, with appropriate user consent and control.

4. AI-Powered Wellness Activities

The AI can suggest activities based on the user's needs.

For example:

- Guided breathing exercises.
- Daily reflections.
- Personalized affirmations.
- Self-care activities.
- Wellness plans.
- Small daily challenges.

Think about how these suggestions can connect naturally with the rest of the application.

5. Chat History

Conversations should be retained so users can return to them later.

Users should be able to:

- View previous conversations.

- Continue an existing conversation.
- Start a new conversation.
- Delete conversations.

The AI should be able to use relevant previous context where appropriate.

Notifications and Reminders

Notifications should be a meaningful part of the experience.

The application should support useful and gentle reminders that help users build healthier habits.

Some examples include:

- Daily mood check-in reminders.
- Daily affirmations.
- Breathing exercise reminders.
- Self-care reminders.
- Custom reminders.

Users should be able to manage their notification preferences and choose when they want to receive reminders.

Notifications should work when the application is running in the background or closed.

Tapping a notification should take users to the relevant section of the application.

The goal is to make notifications feel helpful rather than distracting.

Existing Wellness Experiences

The reference video may include several wellness-related experiences.

You can rethink and improve these as part of your prototype.

Some possible experiences include:

- Mood check-ins.
- Wellness assessments.
- Breathing exercises.
- Daily affirmations.
- Personalized wellness plans.
- Progress tracking.
- Streaks and achievements.
- Wellness resources.

You are not required to reproduce every existing feature.

Focus on creating a cohesive experience where the different features work well together.

You are also welcome to introduce new ideas that make the product more valuable.

Technology

The prototype should be built using:

- **React Native**
- **Expo**
- NodeJs
- Database

You are free to choose the libraries, backend services, database and AI models that best support your implementation.

The AI experience should be functional, and conversations should be retained properly.

Notifications should also be functional.

You can use AI-assisted development tools and other services wherever they help you build a better experience.

Design Principles

The overall application should feel:

- Calm and loving.
- Friendly and welcoming.
- Modern and visually beautiful.
- Personal and emotionally engaging.
- Smooth and easy to navigate.

Pay attention to:

- Typography and spacing.
- Colours and visual consistency.
- Animations and transitions.
- Micro-interactions and haptic feedback.
- Illustrations and visual elements.
- The overall feel of the application.

You have complete creative freedom to explore the design direction.

You can introduce a mascot, AI character or avatar to give the experience more personality.

Do not limit yourself to the reference video. Think about how you can make the experience significantly better.

The goal is to create something that feels amazing to open and genuinely enjoyable to use every day.

🧰 Tech Expectations

Participants are free to choose their stack, for example:

- **Mobile App Required**
  - React Native with Expo
- **Backend**:

    - Node.js
    - Python
- **Database**:
    - PostgreSQL / MySQL
    - MongoDB
    - Can be Firebase / Supabase / simple API

📝 Points to Note

1. **UI/UX: Clean, intuitive, and user-friendly design. Keep the flow smooth and simple.**
2. **Code Quality**: Follow best practices and maintain well-structured code.
3. Backend must be functional and API-driven
4. Core flows (follow, post, message) and functionalities must work end-to-end and smoothly.
5. Doing **one part extremely well** is better than doing everything poorly
6. **App Submission:** Submit the APK and a demo video. In the final stage, you will be required to upload the app to TestFlight; the team will cooperate and might assist with this process.
7. **No Code Submission: You are Not Required to submit your code. Winners will continue development as part of the founding team under expert guidance. This challenge focuses on Skills, AI leverage and creativity.**
8. **Use of AI Tools**: Set up Cursor, Claude, Codex or similar tools to improve productivity and speed act smartly.
9. **Discipline**: We are strict about **discipline** and behavior, so make sure to consider this. Those who stay committed, consistent, and respectful until the end will receive a certificate in recognition of their efforts.

📤 Submission Instructions

1. **Demo Video**
    - Walk through your entire submission.
2. **App Build**
    - APK or
    - TestFlight
3. Join the Telegram group for submissions: https://t.me/+qwqYdoxD9o0yZThl

---

🏆 Prizes and Opportunities

- 🥇 **Hackathon Winner**:
    - The most functional and user-friendly platform creator will receive a **full-time job offer** as a **founding member**.
- 🎖️ **Certificates**:
    - Participants with functional MVPs, even if not winners, will receive **certificates of appreciation** if their submissions are liked by the founders.
- 🎖️ Prizes:
    - Depending on the submissions, prizes may be distributed to the top 3 winners. The prize amounts will be shared later.

🌟 Closing Note

This hackathon is more than a challenge it's a chance to **shape your future** while working on one of the most **advanced projects** out there.

It's a test for your **dedication and obsession** towards your role not just how much you know, but how much you're willing to figure out.

It's a **test of skills over resumes** in the era of AI, you're **completely free to use any AI tool** to do this assignment. What matters is how smartly you use it and how much ownership you show.

We want to work with **people who enjoy challenges**, the ones who keep pushing even when things break, and **don't stop until it finally works.**

Once you’re onboard, you’ll be working with a **team of geniuses** and on some seriously exciting stuff. But before that, you’ve got to **prove you’re the right fit** for this role.

So yeah thank you for being here, and all the very best for this Hackathon!!

We’re looking forward to connecting/working with the person who can ultimately get recognized as an winner of this challenge.
Also, to those who stay till the end and give it their best shot but ultimately don’t end up winning, we’ll be giving a **Certificate of Appreciation** for their **hard work, consistency, determination, and dedication. Cheers and ALL THE BEST!!!** 😉🔥.
